

ITEM T80/007

SUBJECT: AC DELCO DISTRIBUTOR AND COIL/AMPLIFIER UNIT

MODELS: TR7

Some 1980 TR7 vehicles are fitted with an AC Delco distributor and coil/amplifier unit.

The system is electronic with the coil energized via a power transistor. The function time of the power transistor is controlled via the output of a variable reluctance angular transducer. The signal from this angular transducer turns the power transistor on and off as required. Thus, the primary circuit of the ignition coil is made or broken.

There are no air gap adjustments or service required.

Distributor (Fuel Injected)	P/N RKC 3773
Distributor (Carburetted)	P/N PKC 1333
Coil	P/N GCL 128
